

Products & Solutions for professionals like you

***Flexoclean is the most professional developer and
producer of unique cleaning products.
A full-service provider specialising in the
packaging industry!***

OUR APPROACH

International Sales Team

Our Sales Team are not sellers, but advisers at customer level. Every customer is unique and every customer has needs and goals. We map out these goals and work with our customers to achieve them. Everything stems from good communication involving our customers' production staff and Flexoclean's many years of experience. We prepare a full inventory at our customers – in their own language, in their own country and in their own location.

Besides our own sales team, Flexoclean has partners with an agency or distributors worldwide.

For our partners' details, please visit our website: www.flexoclean.nl

- ✓ **Competitive prices thanks to in-house production**
- ✓ **Global distribution**
- ✓ **Personal attention and interest**
- ✓ **Own service department with deep cleaning on site**
- ✓ **Comprehensive knowledge of chemical legislation and water purification**
- ✓ **Dosing systems and advice for consumption control and user convenience**

FLEXOCLEAN IS FLEXIBLE

ADDED VALUE FROM HAVING ALL REQUIRED DI

FLEXOCLEAN HAS EXPERTISE

Projects at customer level

Our Sales Team works with those responsible for production at the customer to gather all the necessary information. This concerns inks, any current products and/or machines used as well as details of the materials that need to be cleaned.

All this information is compiled into a project. The objectives are determined together with the customer, and the task of finding the perfect products is placed in the hands of our Research and Development department.

Research and Development

R&D consists of highly-trained laboratory technicians who have gained a wealth of experience and knowledge in practice. The real-life situation is imitated in the laboratory, and the perfect product is recommended or developed where necessary.

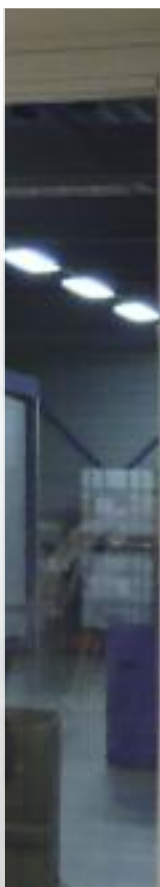

DISCIPLINES IN HOUSE

Laboratory

Chemists employed in our laboratory conduct tests on materials described or delivered as part of the project. They take into account any chemical values provided by the customer. They bear in mind any water purification, sewage, emissions, discharge, pH values, VOC values and cleaning methods. Our chemists only work with safe, registered substances. Once a successful cleaner has been developed to suit the indicated chemical values and cleaning method, a report is written and the project is concluded.

The project is discussed with the customer by the person in charge of sales, and the perfect cleaners can be delivered.

FLEXOCLEAN

FLEXOCLEAN IS MORE THAN A PRODUCT

SERVICE

Deep cleaning of anilox rolls

Flexoclean has more than 16 years of experience in the industry. We have passed many deep cleaning techniques under review. Every periodic deep cleaning method that has come on the market has been examined by our R&D department. Mechanical radiation, with the help of sodium bicarbonate (baking powder), for example, on little plastic balls, damages the line screen of the roll. This can shorten the service life of the roll. Laser cleaning is risky for ceramic rolls because it exposes the ceramics to extreme temperatures. Flexoclean remains convinced that cleaning is a job for chemicals!

With the help of our chemicals, we make the inks portable again and ensure that every component in the ink reacts to the cleaner. This often makes the quest for the perfect cleaner a complex one, but never impossible!

Our service department handles the deep cleaning tasks given by the customer or a Flexoclean adviser. We offer in-line deep cleaning on the printing rolls inside the printing unit or off-line deep cleaning, with the rolls removed, in our Flexmobile.

The Flexmobile, a lorry with a built-in cleaning machine, drives up to your front door. Flexoclean can clean printing rolls up to 3400 mm wide in this machine. The anilox rolls are spotless after they have been deep cleaned by Flexoclean! Line screen volume measurements are taken and reported, with colour photographs of before and after cleaning.

Flexoclean uses this approach to create a good starting point. After this, the perfect daily cleaner must be used to keep the volumes of the rolls constant. A concept that reduces the downtime of printing presses and secures a stable ink formula, a longer service life for the rolls and, most importantly, a consistent print quality!

FLEXOCLEAN IS UNIQUE

AFTER-SALES SERVICE

Less downtime thanks to the perfect concept

Flexoclean also has an after-sales department. The after-sales service performs regular volume measurements on site to check whether the Flexoclean concept is working perfectly and being executed properly. If everything is under control, it will be possible to delay downtime for deep cleaning, resulting in huge savings on costs associated with machine downtime and the use of ink pigments, for example.

Installation of automated dosing systems on the printing presses

Flexoclean invests for its customers. Flexoclean provides automated dosing systems so that the printing units can be flushed automatically. The major advantage here is that cleaning is always done using the perfect mix to suit the printing press and the inks. The benefits to the customer are that the cleaners are used efficiently and sparingly, the printing units are always clean and there is no need to come into contact with the chemicals.

FLEXOCLEAN PRODUCTION AND LOGISTICS

We are meticulous about both the production and the delivery of our cleaners. Our quality control is watertight. Our production staff take batch samples from every production process. These are archived so that we can resolve any issues that arise during use, enabling us to guarantee quality. All products are produced and examined following receipt of the order. The right papers are appended, and transport is arranged. We distribute to anywhere in the world.
